Past, Present and Future Genetic Embryo testing in Cattle

Mark Allan, PhD
Director of Genetic Technology

TRANS OVA
genetics

Historical

Sex determination of bovine embryos by restriction fragment polymorphisms of PCR amplified ZFX/ZFY loci.
Pollevick GD¹, Giambiagi S, Mancardi S, de Luca L, Burrone O, Frasch AC, Ugalde RA. *Biotechnology (N Y)*. 1992 Jul;10(7):805-7.

Sensitive sex determination assay applicable to bovine embryos derived from IVM and IVF.
Kirkpatrick BW¹, Monson RL. *J Reprod Fertil*. 1993 Jul;98(2):335-40.

TRANS OVA
genetics

Why biopsy

- Cost of gestating unwanted genetics
 - \$ values of unwanted calves often females only desired
 - Recipient costs

TRANS OVA
genetics

In vivo Flush Embryo Biopsy Sexing

- Late 1990s early 2000s
- ~75% of *in vivo* embryos were biopsied per flush
- 4-5 cells are needed for PCR
- On average 10% failure rate to generate a sexing result
- Fresh embryos were transferred 2-4 hours after biopsy and results (PCR and agarose gel)
- Slight 5-10% decrease in pregnancy rates
- Embryos implanted costs 2x to produce and 2x test

TRANS OVA
genetics

Industry trends

- Best embryos are biopsy candidates ~75%
- What do with other 25%
- Viable embryos that can not be tested are not high enough quality to freeze
- Cost of embryo production
- Impact on pregnancy rate
- Cost benefit decision models
- Change in technology sexed semen becomes available

TRANS OVA
genetics

Screening embryos for genetic defect carriers embryos

- Parent known carrier of genetic defect
- Biopsy and testing option to create clean progeny

TRANS OVA
genetics

Biopsy and genomic enhanced genetic merit values - embryo selection

Assessment of MDA efficiency for genotyping using cloned embryo biopsies
Lauri et al. Genomics 101 (2013) 24–29

Impact of whole-genome amplification on the reliability of pre-transfer cattle embryo breeding value estimates
Shojaei Saadi et al. BMC Genomics 2014, 15:889

7

TRANS OVA
genetics

What needed for biopsy and HD genotyping

- Whole Genome Amplification
- Freezing of biopsied *in vivo* and IVF embryos for implant after receiving results
- Turn around times for results reasonable 30-40 days
- Pregnancy rates that are not compromised to much

R&D biopsy Whole Genome Amplification

- Create “fake biopsy” using cells lines (10-12 cells per biopsy)
- Replicates of 3 biopsy per cell line
- Control DNA extracted from cell line equals tissue sample from calf

Sample	call rate	Total comparable	Total correct	Total error	%error	Missing Geno
1RF	87	57764	55781	1983	3.43%	8957

Results Confirm Parental Correctional Imputation Needed

- Shojaei Saadi et al. BMC Genomics 2014, 15:889
- Cost benefit analysis
 - 60-70% of IVF embryos produced can be biopsied
 - Remaining embryos are not freezable
 - Preg rate drop ~5-15% for biopsy frozen embryos
 - ~\$40 genomic test, \$50 freezing costs, Biopsy and WGA \$.

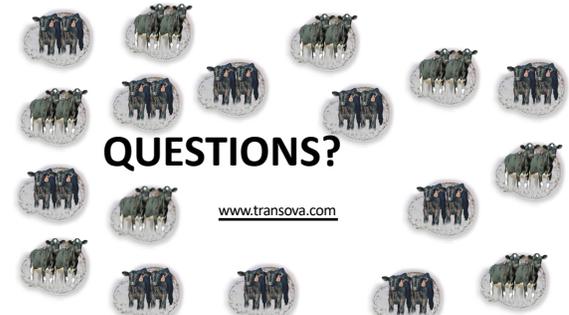

4 years ago ~600 embryos were genomic tested in Canada (Reported by CETA)
The last 2 year less than 200 per year have been genomic tested in Canada.

Current status
